To me, democratization of technology means letting more people use technology so they have a chance to learn and share their ideas. In this reflection, I compare two cases: the Declaration of Independence of Cyberspace and AI democratization.

In 1996, John Perry Barlow wrote "A Declaration of the Independence of Cyberspace" because he was upset with the U.S. Telecommunications Act, which tried to control what people could say online. He wanted the internet to stay free from the government. He wanted anyone to be able to share their ideas, and he believed everyone should be equal, no matter how much money they have or where they come from. In my view, his dream is not really possible today. Most social media platforms have to follow the laws of the country where they work. Every country has its own laws, beliefs, and values, so the internet is still affected by governments.

AI democratization is about giving more people access to new technology. AI can help people learn, work, and make new things. But not everyone has the same access because some people do not have enough money, good internet, or the skills to use it. Nowadays, many students in Nepal can easily use ChatGPT. But many of them do not know how to use it in the right way for learning or for building their careers.

I think both cases are similar because they are both about giving more people access to technology. The Declaration is more about freedom on the internet, while AI democratization is more about giving people access to AI. Both show me that technology can give people more chances, but there can still be problems with access and control.

In my opinion, Free Basics mostly helped Facebook more than the people. Social media is a place where people share their ideas with the world. I think what people share should be open for everyone to see, instead of being inside Facebook's small and controlled space.

I think a company can help people and make money at the same time. Making money is not always bad because a company needs money to keep working and help more people. But I do not think it is fair when a company says it is helping people only to get more power or control. For me, a fair company should help people and also give them choices. People should not feel like they have to use only one company.

Making money is okay when the company is honest and people also get something good from it.

In our in-class activity, we talked about the One Laptop per Child program. Our class felt that it failed because it gave children laptops, but it did not give them enough knowledge or teachers to help them use the laptops.

Until class 6, my school in Nepal did not have computers. Because of this, I changed to another school that had enough computers. There, my teachers taught me computer basics and QBasic programming. I learned how to make simple patterns like star shapes and ladder shapes. My own life is an example of People + Technology = Possibilities.

My old schoolmates were the same kind of students as me, but they did not get the same chance to use computers. Because of this, they had fewer chances to learn these skills, and they fell behind.

In the end, I learned that giving people technology is not enough. People also need teachers, knowledge, and help to use it. Technology can give people more chances, but not everyone gets the same chance. From these examples and my own life, I learned that true democratization is not only about giving people technology. It is also about helping people learn how to use it. When people have both technology and support, they can learn more and have a better future.
